Personal Website: sandoyaa.github.io/personal-website

ABOUT ME

iOS developer focused on building polished, production-ready apps - independently shipped three apps to the App Store.

Previously worked as a frontend developer (React, TypeScript), which shaped a strong foundation in UI/UX, API design, and maintainable code.

Earlier in my career, I served as a navigation officer in the commercial fleet, where I developed strong decision-making skills under pressure, attention to detail, and the ability to operate within strict procedures - qualities I now apply to software development.

TECHNICAL SKILLS

iOS / Swift: Swift, SwiftUI, SwiftData, WidgetKit, StoreKit 2, UserNotifications, MVVM, GCD/Concurrency, ARC, URLSession, LocalAuthentication, XCTest

Frontend: JavaScript (ES6+), TypeScript, React, Next.js, React Native, GraphQL, REST APIs, Tailwind CSS, Ant Design, Shadcn

Tools: Git, GitHub, Xcode

IOS APPS

Money Tracker [App Store](#)

Personal finance tracker for managing assets, liabilities, budgets, and savings goals.

Tech Stack: *Swift · SwiftUI · SwiftData · StoreKit 2 · MVVM · XCTest*

- Architected a complex personal finance system with multi-account portfolios and cross-currency transaction support.
- Engineered a real-time data sync layer using SwiftData and iCloud, ensuring seamless data persistence across devices
- Integrated Yahoo Finance API for live stock/crypto tracking and implemented weighted average cost basis calculations.
- Security: Implemented biometric authentication (Face ID/Touch ID) using LocalAuthentication framework.

Currencies & Rates Converter [App Store](#)

Real-time currency converter with an inline calculator and live Yahoo Finance rates.

Tech Stack: *Swift · SwiftUI · SwiftData · StoreKit 2*

- Optimized network performance by implementing a local caching strategy with SwiftData for exchange rates fetched from Yahoo Finance.
- Developed a custom math expression evaluator for an inline calculator, improving user efficiency during conversions

TimeFeel [App Store](#)

Track any countdown or progress with widgets and smart push notifications.

Tech Stack: *Swift · SwiftUI · SwiftData · WidgetKit · UserNotifications · StoreKit 2*

- WidgetKit integration: home screen widget (systemSmall) and lock screen widget (accessoryCircular, accessoryRectangular) with AppIntents configuration
 - Configurable push notifications: trigger by days/hours remaining or elapsed, % completed, or exact completion moment
 - Radial chart view showing real-time progress, confetti animation on completion, haptic feedback
 - iCloud sync across devices
 - Notification scheduling engine handles timezone changes and background rescheduling
-

WORK EXPERIENCE

Independent iOS Developer | Dec 2025 – Present

- Full-cycle Development: Managed the complete lifecycle of 3 apps (Money Tracker, TimeFeel, Currencies) from architecture and UI design to AppStore publication
- Continuous Learning: Deepened expertise in SwiftData, GCD and other tools while maintaining code quality through modular architecture
- Handled AppStore Connect distribution, metadata optimization, and user feedback integration.

Junior Frontend Developer | Godji Entertainment Provider | Jun 2025 – Dec 2025

- Developed scalable UI components for a live entertainment platform using React, Next.js, and TypeScript.
 - Integrated REST and GraphQL APIs end-to-end: shaped how I design service layers and async data flows in Swift today
 - Bridge to iOS: Gained deep intuition for client-server architecture and async data flows (REST/GraphQL), which I now apply to Swift networking layers.
-
