ABOUT ME

iOS developer focused on building polished, production-ready SwiftUI apps — independently shipped three apps to the App Store.

Previously worked as a frontend developer (React, TypeScript), which shaped a strong foundation in UI/UX, API design, and maintainable code.

Earlier in my career, I served as a navigation officer in the commercial fleet, where I developed strong decision-making skills under pressure, attention to detail, and the ability to operate within strict procedures — qualities I now apply to software development.

TECHNICAL SKILLS

iOS / Swift: Swift, SwiftUI, SwiftData, CloudKit, WidgetKit, StoreKit 2, UserNotifications, MVVM

Frontend / Web: JavaScript (ES6+), TypeScript, React, Next.js, React Native, GraphQL, REST APIs, Tailwind CSS, Ant Design

Tools: Git, GitHub, Xcode

IOS APPS

Independently designed, developed, and published 3 native iOS apps on the App Store — from architecture to App Store submission — without external UI frameworks. All apps support iCloud sync.

Money Tracker [App Store](#)

Personal finance tracker for managing assets, liabilities, budgets, and savings goals.

Tech Stack: SwiftUI · SwiftData · CloudKit (private) · StoreKit 2 · MVVM · Yahoo Finance API

- Architecture: MVVM with dedicated ViewModels for each screen, clean separation of data, business logic, and UI layers
- Multi-account portfolio: assets and liabilities with weighted average cost basis calculation and cross-currency transaction support. User can connect their stocks/bonds via Yahoo Finance API, and charts will be combined.
- Budget engine: weekly / monthly / yearly / custom periods, instrument-scope filtering, transaction-category filtering, progress and overspend alerts
- Savings goals with linked assets, progress tracking, and target date
- Recurring transactions: automatic scheduling and background application
- Biometric authentication (Face ID / Touch ID) via LocalAuthentication
- Real-time currency conversion using live exchange rates; CSV export
- Full iCloud sync across devices via CloudKit private database

Currencies & Rates Converter [App Store](#)

Real-time currency converter with an inline calculator and live Yahoo Finance rates.

Tech Stack: SwiftUI · SwiftData · CloudKit · StoreKit 2 · Yahoo Finance API

- Fetches live exchange rates from Yahoo Finance API and caches them locally with SwiftData
- Inline calculator keypad with full expression evaluator — convert while computing amounts

- Favourite currencies list synced across devices via CloudKit
- Premium tier unlocked via StoreKit 2 in-app purchase
- Dynamic app theme (Light / Dark / System) persisted in CloudKit

TimeFeel [App Store](#) 

Track any countdown or time interval with widgets and smart push notifications.

Tech Stack: *SwiftUI · SwiftData · CloudKit · WidgetKit · UserNotifications · StoreKit 2*

- WidgetKit integration: home screen widget (systemSmall) and lock screen widget (accessoryCircular, accessoryRectangular) with AppIntents configuration
- Configurable push notifications: trigger by days/hours remaining or elapsed, % completed, or exact completion moment
- Radial chart view showing real-time progress, confetti animation on completion, haptic feedback
- iCloud sync via CloudKit; StoreKit 2 premium paywall; onboarding flow
- Notification scheduling engine handles timezone changes and background rescheduling

WORK EXPERIENCE

Junior Frontend Developer — Godji Entertainment Provider

Jun 2025 – Dec 2025

Tech Stack: *React · TypeScript · Next.js · Ant Design*

- Built scalable, component-driven UI for a live entertainment platform in React + Next.js + TypeScript — gained the client-server mental model and API design intuition that directly transferred to iOS network layer work
 - Integrated REST and GraphQL APIs end-to-end: shaped how I design service layers and async data flows in Swift today
 - Maintained code quality through Git branching, code reviews, and Ant Design component standards in a team setting
-
